

## **MAPPING Suite XPS raises the bar on enterprise communications**

### **Boulder, Colorado – June 15th, 2010**

InfoPrint Solutions Company and Mapping Groupe today announce the availability of the MAPPING Suite XPS software system. MAPPING Suite XPS represents a single, comprehensive communication software system built on the foundation of an open, flexible architecture and packaged to address the complex input, processing, and output needs of today's business communications.

### **An open, flexible communications architecture**

MAPPING Suite XPS is centered on Microsoft's XPS (XML Paper Specification) technology, a rapidly emerging open standard that is consistent with the most widely used communication formats used in today's documents. XPS makes it easy to use typical document content created in XML, RTF, and Microsoft Word formats plus a wide variety of other input formats. The continually growing universe of drivers for XPS ensures that typical output formats (PCL, PostScript, RFID, thermal, etc.) are supported.

### **Manage the complete range of document workflows**

Typical document processes must solve three basic challenges – (1) the connection and import of various enterprise data sources and formats, (2) the design or redesign of business documents, and (3) the production of those documents in different formats and through multiple channels. Effectively handling each of these areas was a strength of MAPPING Suite prior to the arrival of XPS. With MAPPING Suite XPS, your capabilities in each of these areas are significantly expanded. You'll find that most of your document workflows can now be addressed with one comprehensive toolset -- MAPPING Suite XPS.

### **Select the packaging that fits your business**

While Mapping Suite XPS provides comprehensive functionality, the capabilities are grouped into packages that relate to typical business environments. The packages range from basic document design to RFID and thermal production to advanced communications with dynamic marketing content. In addition, each package can be augmented by options that add support for multiple electronic channels (Web, email, fax, archive, text) and advanced database access and layout. Finally, the software is segmented by volume so that you can match your specific workloads. The bottom line is a tailored package that precisely meets your requirements.

### **About Mapping Groupe**

Mapping is a software development company specializing in output management applications designed to provide cost-effective enterprise document management solutions to a wide range of businesses. With over 20 years' experience in the Printing industry, MAPPING's strong partnership with InfoPrint Solution Company has now led MAPPING Suite to become an output management industry benchmark on a global scale.
